

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

I. *Extract of the Minutes of the Philosophical Society at Oxford, March 18. 1683. concerning Irish Slat.*

IT having been discours'd to us about Nine or Ten Months since, by the ingenious Mr. Kenwick, Physician at Worcester, that the Irish Slat Pulveriz'd, and infus'd in Water for a Night, or less, would impart its Vitriolick Quality so far forth to it, that it would strike of

a faint reddish Colour with Powder of Galls (as the *Vitriolic Waters of Tunbridge, Astrop*, and divers others do, and as you see it has in some Measure done in the Example here before you) it not only led me to believe that these Waters, some of them, might as well issue from Slat as an Iron Oar; unless it should appear, that this sort of Slat were an Iron Oar too, which put me upon calcining it for Three or Four Hours after the manner of *Dr. Lister*, to experiment, whether it would then (like the other Iron Oar) apply to the Magnet; wherein tho' I was altogether unsuccessful, the Magnet not taking the least notice of it, yet it afforded me another Discovery altogether as satisfactory, which is the Matter I have at present to communicate to you; *viz.* That upon Torrefaction it was all become a Yellow Ochre, and would score like it; tho' this here I have to shew you, be grown a little too dark by much burning, which further persuades me, that the Yellow, or rather Orange-coloured Sediment we find at the Bottom of these Fountains, comes rather from this sort of Slat, than an Iron Ore; for I much question whether some of the Yellow Ochres (tho' it's plain the Red ones do) come from, or are, Iron Ores; but I intend to calcine this further the next Week, whereof you shall have an Account the next Meeting, but doubt of my Success, because the *Shotover* Yellow Ochre will not own the Magnet after Thirty-six Hours Calcination, or better.
